# Overview

## Introduction

Goal

Architecture

## Algorithms

Transforms

Bug Algorithms

Filtering and Mapping

## Design Patterns

Patterns in Use

## Development Methodology

Workflow

## References

## Goal (Basic)

Given a goal and a robot:

- ▶ Turn the robot around
- ▶ Identify the goal object from LRF input
- ▶ Move towards the goal

## Goal (Advanced)

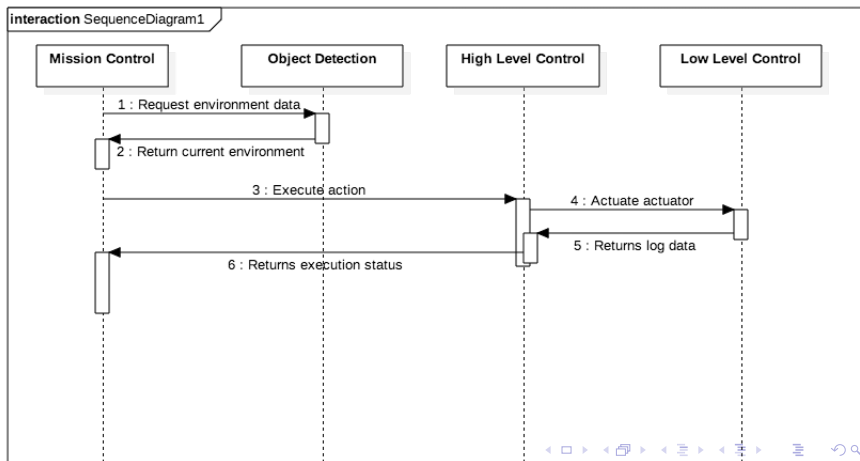

Given a goal, a robot, and a maze:

- ▶ Turn the robot around
- ▶ Follow the walls and avoid obstacles
- ▶ Identify the goal from LRF input
- ▶ Move towards the goal if nothing blocks

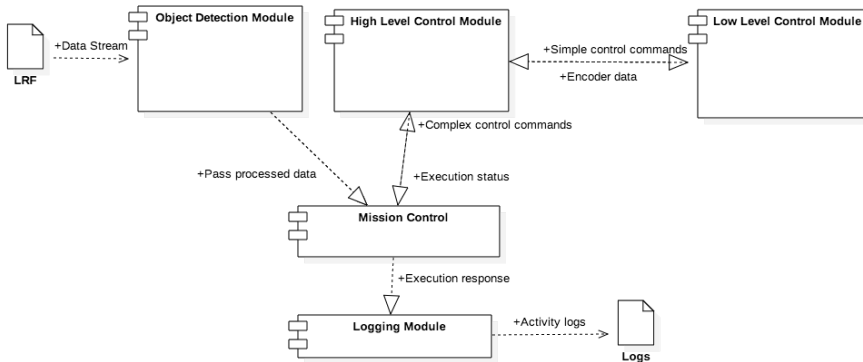

## Goal (Advanced)

# Sequence Diagram

# Component Diagram

# Class Diagram

# Hough Transform

- ▶ Algorithm to detect imperfect instances of geometric shapes
- ▶ Reduces the amount of data to be processed
- ▶ Usage
  - ▶ Detect outer walls and obstacles
  - ▶ Detect goal (Semi-Circle)
- ▶ Idea (line detection case)
  - ▶ Calculate the equation of the line through two consecutive points
  - ▶ Coefficients of the equation are added to a counter to record how many times the same equation is calculated
  - ▶ Coefficient calculated often equate to many points being roughly aligned

# Hough Transform

# Bug algorithms

- ▶ Knowledge of local environment and a global goal
- ▶ Assumptions
  - ▶ Known direction and distance to goal
  - ▶ Obstacle detection and encoder data
  - ▶ Finitely many obstacles in finite area
- ▶ Idea
  - ▶ Head towards goal
  - ▶ Follow obstacles until you can head towards goal again
  - ▶ Stop if there is no path to goal

# Bug Algorithms

# (Modified) Bug algorithms

- ▶ Missing assumptions
  - ▶ Distance to goal is not known
  - ▶ Direction to goal might be imprecise (slippery surface, wrong encoder data)
- ▶ Additional assumptions
  - ▶ Environment has a rectangular shape
- ▶ Greedy approach
  - ▶ Head to the wall you are initially facing
  - ▶ Follow the walls until see the goal
  - ▶ Head to the goal

# Noise

# Kalman Filtering and Mapping

- ▶ Kalman Filtering (Linear Quadratic Estimation)
  - ▶ Input
    - ▶ A series of measurements of a variable obtained over time
    - ▶ Observations contain statistical noise
  - ▶ Output
    - ▶ Estimates of the values of the variable
    - ▶ These estimates tend to be more precise than one time measurements
- ▶ Mapping
  - ▶ Create a dynamic map of the surrounding environment
  - ▶ Use this map to reach the goal faster after the first iteration
  - ▶ Needs Kalman Filtering to get precise position of gaps, walls and goal

# Singleton

- ▶ Comes from the mathematical 'Singleton (a.k.a. Unit set)'
- ▶ Restricts the instantiation of a class to one object
- ▶ Defines a 'getInstance' operation to expose the unique instance
- ▶ Useful when exactly one object needed to coordinate actions
- ▶ getInstance responsible for creating class unique instance

# Mediator

- ▶ Behavioural pattern - Can alter the program's running behaviour
- ▶ Communication between objects encapsulated with a mediator object
- ▶ Objects no longer communicate directly with each other
- ▶ Reduces the dependencies between communicating objects, thereby lowering the coupling

# Stay Agile! Stay Alive!

- ▶ Biweekly code sprints
- ▶ Trello for task management and tracking backlog
- ▶ Daily standups to keep track of progress and blockers
- ▶ Weekly review and retrospective
- ▶ Coordinated Pair programming sessions
- ▶ End of sprint celebrations (Motivation!)

# Testing

- ▶ Test Driven Development (TDD)
  - ▶ Write tests before code
  - ▶ Helps clearly plan out program functionality
  - ▶ Reduces debug time drastically
- ▶ Focused on four different domains:
  - ▶ Unit Testing
  - ▶ Integration Testing
  - ▶ System Testing
  - ▶ Stress Testing

# Version Control

- ▶ Git (using Github for remote)
- ▶ Divide tasks into issues
- ▶ Branching Model
  - ▶ Each issue to be a separate branch on the remote
  - ▶ To be merged back in to the master after completion of issue
- ▶ Pre commit hooks for code style guideline compliance

# Deliverables and Timeline
